Statement on the US government directive to suspend access to Fable 5 and Mythos 5

12 Jun 2026

The US government, citing national security authorities, has issued an export control directive to suspend all access to Fable 5 and Mythos 5 by any foreign national, whether inside or outside the United States, including foreign national Anthropic employees. The net effect of this order is that we must abruptly disable Fable 5 and Mythos 5 for **all** our customers to ensure compliance. **Access to all other Anthropic models will not be affected.**

Why Tensorx

When to go to the cloud

- "Friends Don't Let Friends Build Data Centers" — Charles Phillips during the move to cloud
- Anthony explains what they do

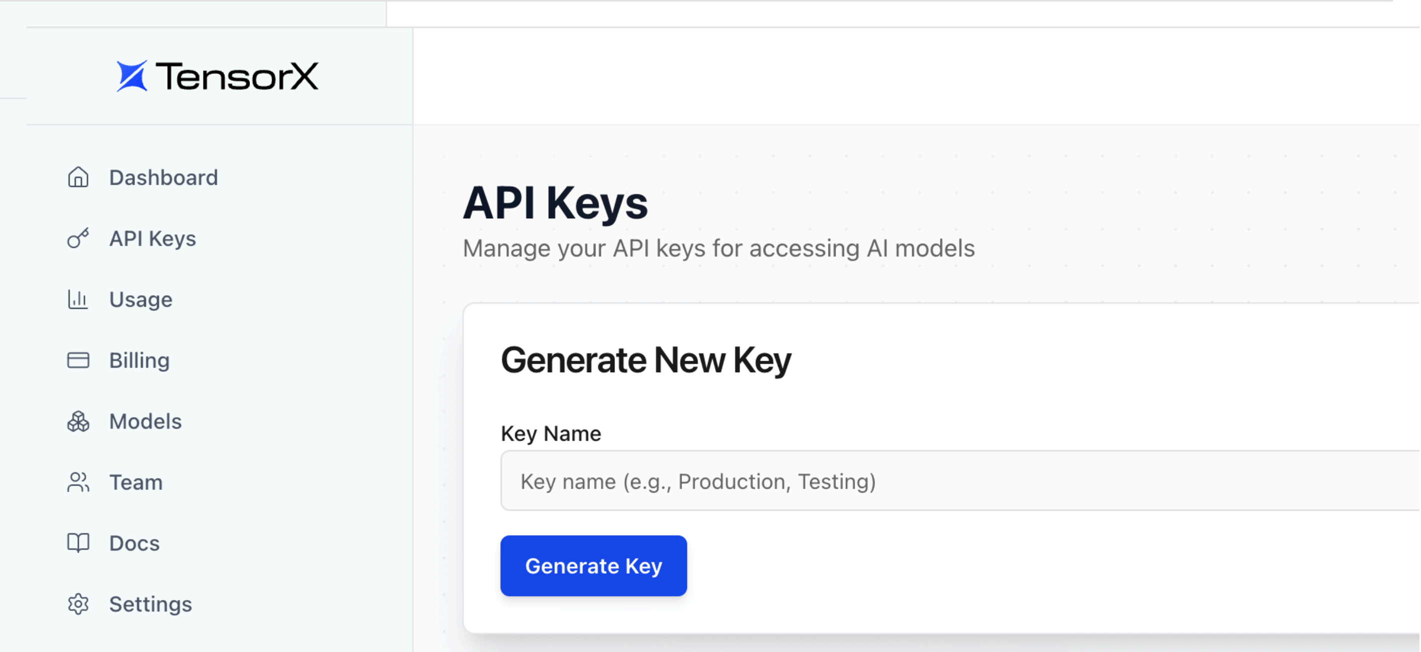
Why Tensorx

When to go to the cloud

Generate a key called Firstapp (or something). Save it well use it in a minute



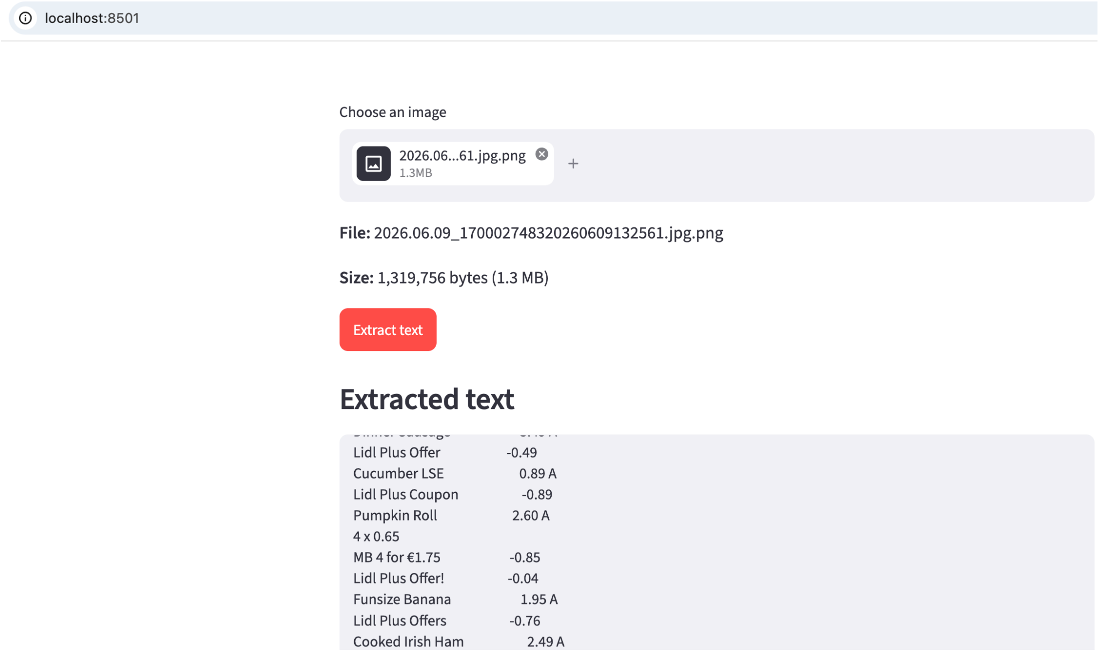
Get cursor

https://cursor.com/download

```
git clone https://github.com/cavedave/SpecDriven.git
cd SpecDriven
python3 -m venv .venv
source .venv/bin/activate
pip install -r requirements.txt
```

This Setup is the hard part

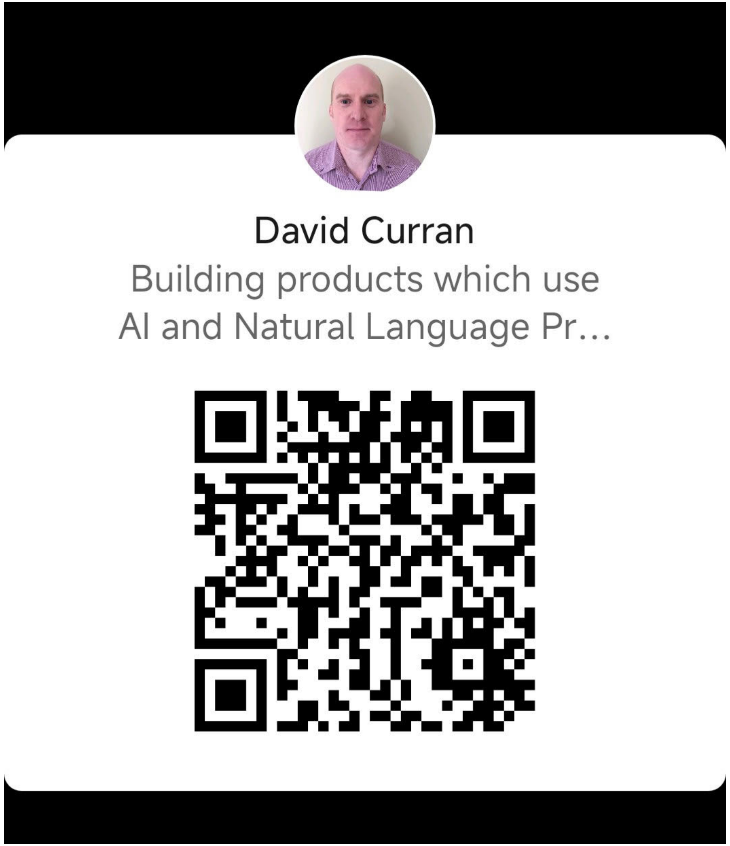
- What we are trying to make



About David

Developer 20+ years experience

- Security
- Data analysis and visualisation
- Team Lead with IBM Watson
- Lead the development of Chatbot system to OpenJaw in Chinese and English.
- Software Architecture and AI roles
- Analyst in Centre for Cybercrime investigation



About Alex

Developer 20+ years experience

- UCD CCI
-

About Denys

- CS Student
- To help you with any issues
- Likes motorcycles

This Talk

Things you can do with LLMs

- What is Tensorx
- What is spec driven development
- Lets make an app

`Repo: github.com/cavedave/SpecDriven`

What to do with an LLM

Generative AI

- Generate stories
- Classify emails
- Text to image and image to text -We are doing this
- Translation (basically where they came from)
- Coding assistant
- Summarise
- Shout ideas

AI Categories

Predictive AI	Generative AI	Agentic AI
Structure unstructured data — e.g. extract sentiment from text	Create marketing content	Generate (and potentially execute) recommendations for lead generation
Cluster users by behavioural characteristics	Explore a large space of chemical compounds for a new drug	Make recommendations for sales scripts based on customer data and responses
Predict stock price developments	Generate novel design ideas based on existing designs	Robot interacting with the physical world, e.g. via IoT or 3D printing

Stay Local?

When to go to the cloud

- "Friends Don't Let Friends Build Data Centers" — Charles Phillips during the move to cloud
- Why would we ever go back to on-premises? We thought at the time
- Mainframe → Home PC → Cloud → Home LLMs
- A GPU hour is really cheap right now. You need enough compute to do work and tests locally.
- But for training on any 'normal' data — do it in the cloud.
- Basically: don't spend tens of thousands on hardware unless you have to

Build tools for yourself

- Then your team
- Then the company
- Then others
- Or if you're not working: self, friends
- Friends here is someone who will talk to you, test for you and can pay you eventually

Lean pub book on Spec driven development

- It might be wrong.
- But at least its wrong
- Not ‘ask the computer’, jazz hands…

Spec Driven Development

Build With AI Without Losing Control

This book is a translation into English of Spec Driven Development which was originally written in Spanish

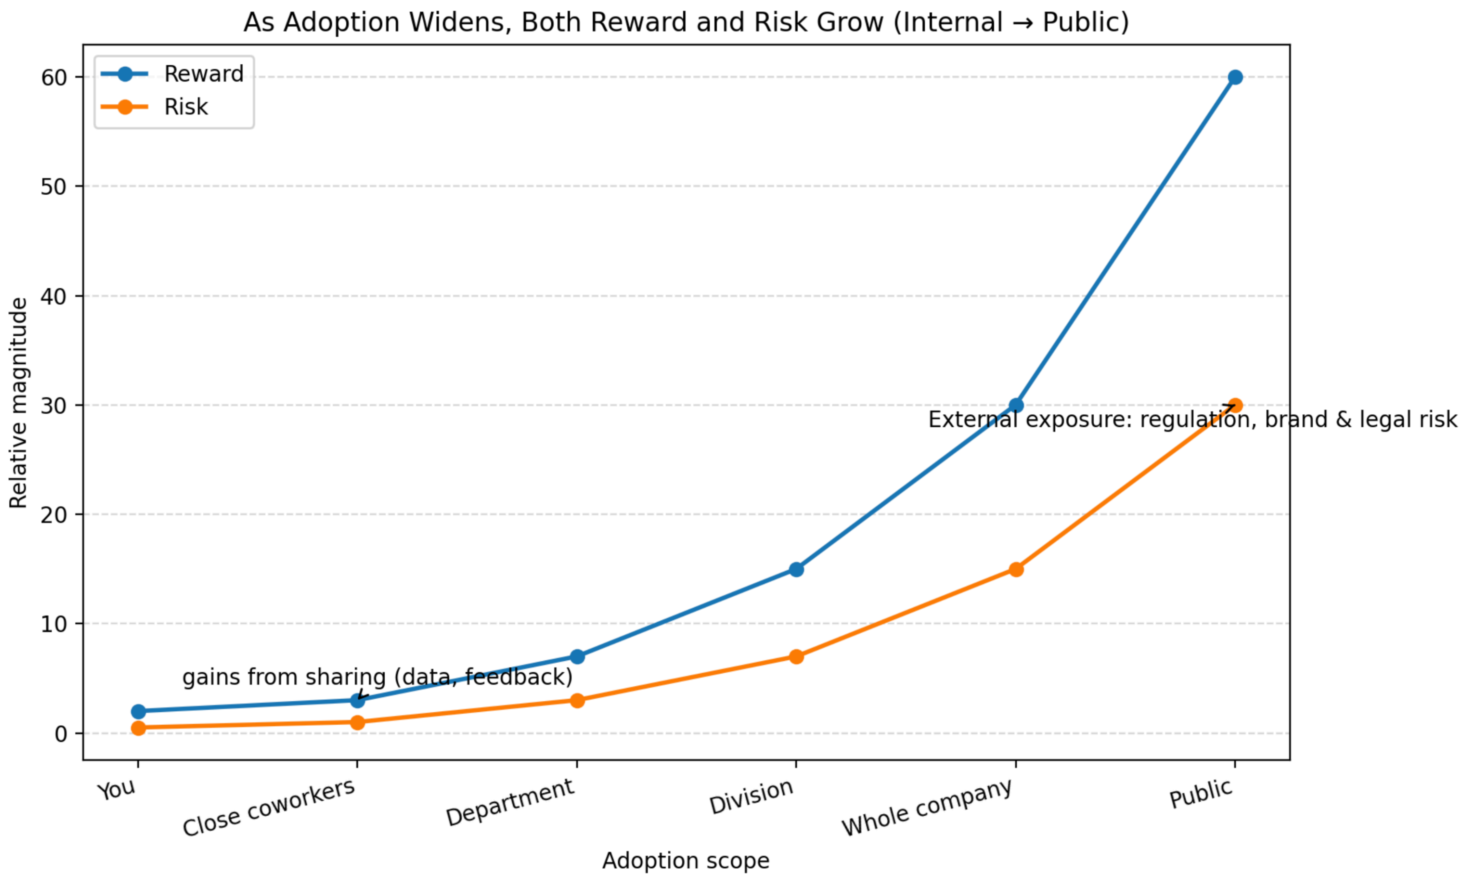
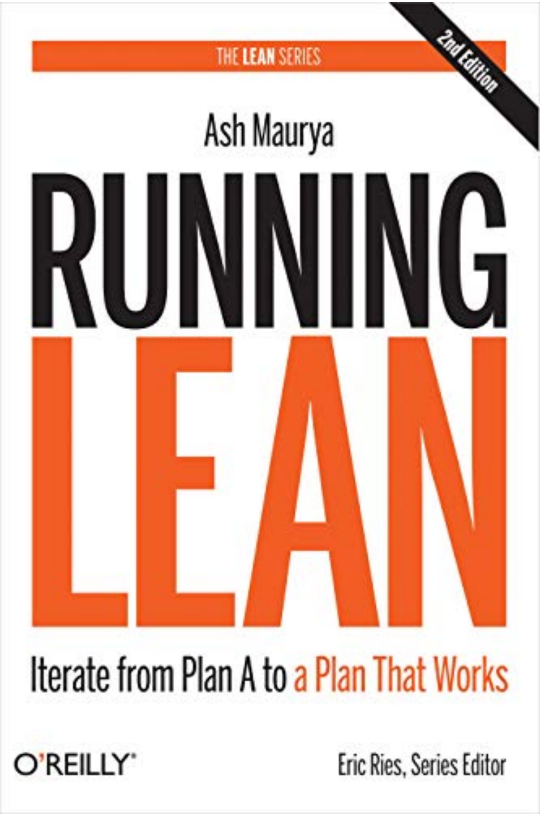
As Adoption Widens, Both Reward and Risk Grow



Book on how to develop

There's loads. This is the best I've read



Iterate from Plan A to a Plan That Works

The Actual Code

Create Virtual Environment

The actual work

```
git clone https://github.com/cavedave/SpecDriven.git
cd SpecDriven
python3 -m venv .venv
source .venv/bin/activate
pip install -r requirements.txt
```

Spec driven development

- The Spec is an artefact
- It survives the process that created it. Like the code, like an exe, like tests
- It is not a summary of a plan. It is a source of truth for what is built
- Traditionally specs are late, ignored and out of sync
- Here the sync builds the code

Spec driven development

- A spec is a contract between you and the agent
- About expected behaviour
- Not expected technology or architecture
- Build matches spec -> Done
- Build not correct or not complete -> change the spec

Spec Describes Behaviour

- **Who** will use the system
- **What** they want to achieve
- **What** the user can do
  - User solid verbs here. Create, deleted, export
- **When** things will happen. User Journey
  - Agents tend to expand scope a lot. This keeps them controlled
- **What** cannot be done
- **What** must be true. Acceptance criteria
- **What** you assume
  - Already exists. Not changing this cycle

Grilling

- Ten minutes of back and forth can save you days
- I am going to build X. Before we write the spec ask me any questions you need to fully understand expected **behaviour**. Minimum ten questions.

Steps in a spec

- Idea. Here we pretend OCR receipts
- Research. In research.md. Depends on how much you know. Things you find out like ‘This model is best for OCR’
- Prototype. Sometimes you do vibe code just to discover what you want to build
- Produce Requirement Document. The spec
- Kanban. Spec turned into concrete steps.
  - Vertical slices. Implement a feature
  - Tracer bullets. Spike to reduce uncertainty
- Execution loop. Agent makes the code
- QA. Even more important in this process.

Steps in a spec

- Spec is about 500 words. Not huge
- Do manage context. End by saving context and start by loading it.

Spec Driven Loop

constitution → specify → plan → tasks → implement → test/review → refine spec → repeat

Actual Steps

- 1. python hello_tensorx.py
- 2. /speckit.specify
- Receipt reader slice 1: Streamlit app where I upload a receipt image (jpg/png). Show file name and size in bytes and human-readable KB/MB. No API calls, no Pillow. Standard app.py layout.

Actual Steps

- 3. /speckit.plan
- /speckit.tasks and /speckit.implement

- 4. source .venv/bin/activate
- python -m streamlit run app.py

Actual Steps

- 5. /speckit.specify

- Receipt reader slice 2 (OCR): User uploads a receipt image (jpg/png) — slice 1 ingest (file name + size) must remain. Add an explicit "Extract text" button that sends the uploaded image to Tensorx via tensorx_client.extract_text_from_image() using the configured vision model (TENSORX_MODEL from .env). Show extracted text on the page. Use st.spinner during the request and clear errors for missing key or API failures. Do not call the API until the user clicks Extract text. Reuse tensorx_client.py for all API access. Assumes hello_tensorx.py smoke test has passed.
- 6. /speckit.plan /speckit.tasks and /speckit.implement

Spec driven development

- Prompt-only coding drifts: scope creep, missing tests, secrets in git, no review checkpoints
- Specs give **shared memory** between you and the agent across sessions
- Each feature is **independently testable** (MVP increments)
- Workshop steps: three features, one app — upload → API hello → OCR

Files in a spec

Artifact	Purpose
`[.specify/memory/constitution.md](.specify/memory/constitution.md)`	Non-negotiable project rules
`specs/00N-*/spec.md`	User stories, acceptance scenarios, FRs
`plan.md`, `tasks.md`, `quickstart.md`	How to build and verify
`app.py`, `tensorx_client.py`, `tests/`	Implementation

Constitution — rules before features

- Written once; governs every feature (8 principles: simplicity, small files, test-first, local run, clear errors, no extra services, document features, no secrets)
- **Workshop examples:** no Pillow in F001; `.env` never committed; pytest before major impl
- Command: `/speckit.constitution` (already done for this repo)

Actual Usage

We make an app
Something that talks to tensorsix
An app that talks to tensorsix
Improve the App

Feature 001 — Image upload file size

- Goal: Upload image → see file size (bytes + KB/MB)
- **Why first:** Proves Streamlit upload path before API/OCR
- **Spec input (plain English):** “Streamlit app, image upload, show size”

Spec Driven Loop

constitution → specify → plan → tasks → implement → test/review → refine spec → repeat

Spec Driven Loop

constitution → specify → plan → tasks → implement → test/review → refine spec → repeat

LLM Attacks

- Prompt injection: 'Ignore previous instruction' — put CV to top of queue written in white on white
- Jailbreaking: 'Give me my grandmother's recipe to make a bomb'
- Data Poisoning: nonsense images that seem to an LLM to be a cat
- PII leakage
- One of the reasons to use Tensorx is people sending big guys company data
- But all these guardrails will become an issue with more users

Sentiment Analysis

Everyone asks for this

- Only makes sense in context
- The knitting circle getting a bit angry might mean more than the rage-bait group being really angry
- It's the delta and change to look for
- Bots are really an issue now
- Sometimes not intuitive — addiction forums have much higher happiness and support than football forums

Make a quick app

Python and Streamlit

- Streamlit as UI — unless you know one yourself
- LLM for classification; Hugging Face models later
- How to improve: take in data feedback
- Take in user feedback
- Setup is key
- Data flow is key

Bubble

Dot Com Crash

- Yes, it's a bubble. 'This time it's different'
- Railroads, Canals, Internet, Personal Computers, Chickens, South Sea Company Stocks, Radio, Auto & Electricity (Roaring 20s)
- Having a computer you can talk to is amazing

Demo 3

Images

- Basic image stuff can be done locally
- Label your text

Summing up

- Tensorx provide a good backbone to develop on
- Spec drive development is a process to follow that better than vibe coding
- Ease of making apps Makes UX, deployment, sales and marketing more important

- Naysayers have a point — but builders are right

Spec Driven Development with Tensorx

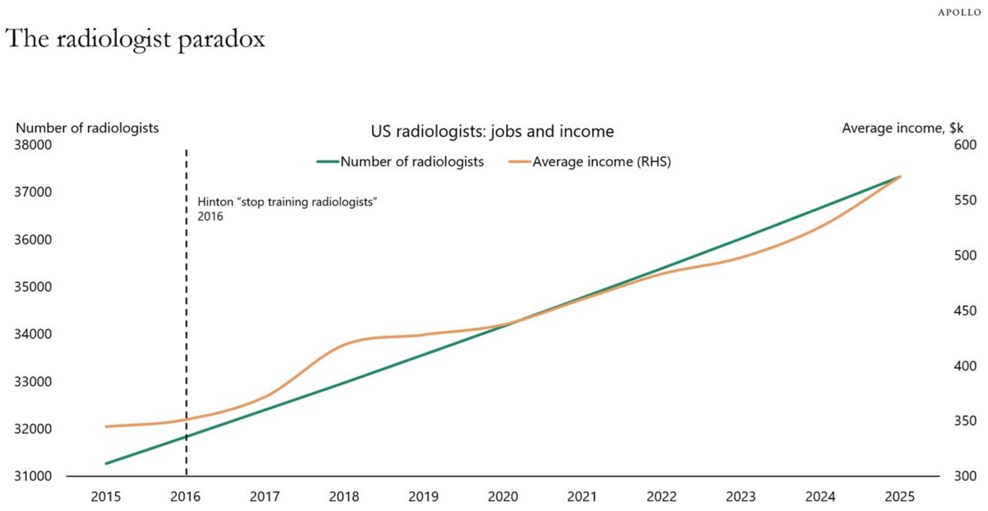
David Curran Alex Cronin · June 2026

There will always be problems

Every fix brings new problems

- Every speed up makes the parts that can't be speed up more valuable
- Move to synthetic rubber tires made rest of bicycle work more valuable
- Radiologists were predicted to be gone by now. But automation made them more valuable.



Taste is Important

AI increases the returns to good judgement where it doesn’t have it

- People with good taste know when they do bad work
- That’s why they improve to do good work
- But they get annoyed by bad work. Getting over this annoyance is important
- Taste is books, films, clothes, music, web design, cars everywhere
